# Project Details

## 1) Project Title

Electro - Sustainable Electricity Model for Domestic Users

## 2) The Goal and Objectives

Our end goal of the project is to introduce a sustainable electricity model for domestic household users to select between normal electricity billing model with TOU (Time of Use) model, where our proposed system will provide suggestions to further reduce electricity usage when the TOU method is selected as the best and most applicable electricity consumption model to reduce the electricity bill value. And eventually, our proposed solution will help to reduce the energy crisis in the country.

### Objectives

- To provide a better understanding about the way how the electricity bill is calculated for the local domestic electricity users.
- To give suggestions about how to reduce the electricity bill when using the TOU plan based on domestic electricity consumption.
- To make a sustainable model where users can select their corresponding method on electricity billing based on their need and usage.
- To make the model more ‘user friendly by creating simple and efficient user interfaces.
- To support domestic users to work according to a time frame in order to reduce power consumption.
- To give a better understanding for the users about their device wise usage using graphical charts.
- To minimize the loss happen to the electricity board by promoting the TOU Plan to the consumers.

### 3) Problem Definition

In Sri Lanka, there are two models to calculate the electricity bill for domestic householders[1][2].

1. The electricity connection that charges based on the number of units of consumption (Block) [1].
2. The electricity connection that charges based on the time of use (Time of Use (TOU))[2].

Most of the electricity users in Sri Lanka have the fixed unit billing method to calculate their electricity bill where electricity consumption cost is calculated using a fixed charge based on the consumed units. This fixed bill calculation is the default billing cycle for household consumers. However, there exists another approach called Time of Use (TOU), where electricity consumption is calculated for each month considering power usage in peak, off-peak and day-time charges. As TOU is an additional approach where consumers have to enroll, the TOU method is less popular among household consumers due to unawareness. Not every user can benefit from the TOU method or fixed billing unless the consumer estimates his/her consumption manually. Further, there is no proper platform/ tool to check the most suitable billing method to use considering electrical devices anticipated to be used in the household. Furthermore, there is no mechanism to get clues/suggestions and predictions about bill predictions based on the using billing method to further minimize the value of the bill without limiting the usage of electrical units by using the TOU method.

When the **number of electric devices is increasing** in a particular household, it will be extremely difficult for users to regulate their electric equipment device-by-device in order to reduce their electricity bills. At the same time, it will be quite difficult for the consumers to calculate the amount that can be saved and the effect that may happen for their bill device-by-device.

#### **4) A brief introduction to the project**

Our Proposed system will consist of a mobile responsive web application where users can use whichever electricity calculation method is handy for them based on their consumption. After a particular user logs in to the system, they can select a list of electric items they have in their house and enter its power(in Watt) and the electricity usage of corresponding items. When getting inputs from the users, we will be setting a priority level for the devices according to the usage necessity. It means that users have to prioritize the devices which they can switch the usage from the Peak time period to the Off-Peak time. (Example: When we have a rice cooker at home which we can not switch the usage time, we have to give a high priority not to change the device usage time. And if we use an iron which we can switch the usage time to, we have to give less priority to it) Then the system will automatically calculate the monthly bill considering both the fixed unit billing method and the Time of Use (TOU) method as proposed in our system.

If the TOU method is identified as the best method for the consumers, we will be providing suggestions to further reduce electricity consumption by incorporating our proposed scheduling algorithm. When giving suggestions, we will be showing the consumers how much they can save by each device. Finally, we will show the total amount which consumers can save according to the given suggestions and further users are able to visualize their savings using charts.

Using our system, users can get a proper understanding about the electric usage of each individual device separately and what portion of the bill is allocated for a particular device by using both methods. So the consumers can get an idea about which device consumes more electricity units. Consumers can also get their future predicted electricity usage, if they have a special event in their home where they have to use more electricity. So they can get an idea about the bill in that specific month to check whether that amount is feasible to them or not and plan accordingly.

When we register a user to the system, all the details given by that user will be saved to the system. So that, the users do not have to enter the same details about the electric devices which they have in their house when calculating the bill in future months once again. (Example: When the user got a new electric guitar, he only has to enter the details about that new device when calculating the bill, as the details entered about the previous devices are already saved in the system)

## **Proposing algorithm**

The heart of the proposed system lies in the proposing scheduling algorithm that tries to schedule electrical equipment in an optimal manner which can be beneficial to the consumers to further reduce their energy consumption.

- With the growing need of electrical devices, our proposing algorithm tries to schedule them considering the urgency level (high priority / high urgency-in this case device need to use during the specified time by the user, mid priority / mid urgency-device can use moderately in the specified time period, low priority / low urgency-device usage is not mandatory in the specified time period, it can move to any low-cost time slot).
- As scheduling algorithm complexity is in the NP domain (with the growth of the electrical instruments), we are proposing an algorithm that considers a heuristic-based scheduling algorithm that considers urgency level, operating time interval, and power usage into account. Our heuristic algorithm will produce results in polynomial time as the electrical instruments in a usual household do not increase exponentially.

## **Motivation**

Energy consumption is a tremendous challenge in a country as well as the world since the demand for electricity usage grows day by day. Our proposed model will support countries' energy crisis by reducing peak electricity usage hours and help the users to consume electricity mindfully. And also, this system, it will minimize the loss that may happen to the electricity board by promoting the Tariff plan to the consumers.

## **Similar/Related Projects**

We have found a related project named 'CEB Care'[3]. It has the following features.

- Lodge Electricity Complaint
- Manage Multiple Electricity Accounts
- Interruption Alerts
- Interruption Calendar
- Check Bill Information
- Check Payment Information
- Make Online Payment
- Usage Estimation
- Bill Calculator

However, our focus is to compare the fixed model with the TOU(time of use) and provide suggestions to reduce electricity consumption. so the ideas and focus of the two projects are quite different. And also, the application which we are introducing mainly focuses on giving suggestions by proposing a scheduling algorithm that tries to schedule electrical equipment in an optimal manner which can be beneficial to the consumers to further reduce their energy consumption when they use the TOU(Time of Use) model.

## **5) The scope of the project**

We are proposing a mobile responsive web application that will calculate the electricity consumption of domestic household users based on the unit-based model and TOU model. Furthermore, our system will provide suggestions to choose the best model based on electricity consumption and further reduce unnecessary electricity usage.

### **Users (possible actors) of the system**

- Admin
- Users
- CEB Engineer

### **Main functionalities of the system**

Common for all the user roles

- Login
- Logout
- Updating the user profile
- View the electricity unit charges for both the Fixed model and TOU model

Users

- View their calculated monthly bill using both the Fixed model and TOU model.
- View the device wise usage using charts for both methods in the monthly bill plan as well as in the special events plan.
- View the suggestions to reduce their electricity bills for the TOU model.
- Manage (Add/Update/Delete/View) monthly electricity bill plan details using both models.
- Manage (Add/Update/Delete/View) special events bill plan details for a specific time period using both models.

Admin

- Managing unit charges received by CEB Engineer

- Adding a new CEB Engineer to the system
- Deactivating an available CEB Engineer from the system
- Updating details of the available CEB Engineers in the system

#### CEB Engineer

- Informing about the changes of the unit prices to the admin

### Out of the Scope

- The current system will only be limited to handle domestic household usage.
- We are only calculating the bill according to the details given by the user(Ex: Power of the electric item).

## 6) Feasibility Study

### 6.1 Operational Feasibility

This measures how well our solution satisfies the problem stated above and how well it addresses the requirements stated.

After conducting a survey and collecting ideas from more than 170 individuals, we got to know that over 90% of participants from the lot liked to have a web application/mobile app to calculate their electricity bill according to the electric items they have in their houses and to get tips to reduce their monthly electricity bill.

Will you use a web application/mobile app to calculate your electricity bill according to the electric items you have in your house and to get tips to reduce your monthly electricity bill, if there is a such system? / ඔබ නිවසේ භාවිතා වන විදුලි උපකරන අනුව, ඔබේ මාසික විදුලි බිල ගණනය කිරීමට සහ ඔබේ මාසික විදුලි බිල අඩුකරගැනීම සඳහා උපදෙස් ලබා ගැනීමට වෙබ් අඩවියක් හෝ ජංගම දුරකතන යෙදුමක් භාවිතා කිරීමට ඔබ කැමතිද?

173 responses

And also, we got to know that over 80% of participants of the survey use electricity at night time where the government spends more money to produce one electric unit which is higher than the price the government charges from the consumers for one unit.

What time in the day do you have the higher power consumption? / ඔබ දවසේ වැඩිම විදුලි පරිභෝජනයක් සිදු කරන කාල පරාසය කුමක්ද?

173 responses

According to the survey, 80% of the participants do not know about the TOU method where users can reduce their electricity bills when using this method.

Have you ever heard about a method that calculate the electricity bill using the time of use(Time of use(TOU) TARIFF) , instead of normal electricity billing model? / සාමාන්‍ය විදුලි බිල්පත් ක්‍රමය වෙනුවට, දවසේ ඔබ විදුලිය පරිභෝජනය කරන කාල පරාස අනුව [TOU (TARIFF ක්‍රමය)] විදුලි බිල ගණනය කරන ආකාරය පිළිබඳව ඔබ දැනුවත්ද?

173 responses

By our proposed system, we introduce a sustainable electricity model, where domestic users can select which method is most suitable for them between the normal billing method and the TOU method. This will also help users to be aware of the TOU method while getting suggestions to reduce the electricity bill.

Considering all the facts mentioned above, we can assure that our project is operationally feasible.

## **6.2 Schedule Feasibility**

This measures how reasonable the project timeline is. We have gathered most of the requirements when it comes to the functionalities and will be continuing the same with other possible requirements while developing the system.

As the requirements are gathered already, we hope to design the system whilst discovering methods to enhance the user experience of the system.

We will be planning to do the development and testing parts according to the timeline we came up with. So, by the end of this semester, we think we can implement the system as scheduled in our timeline.

There can be exceptions because of the current situation in the country. But we will be working hard to stick to the timeline and develop the system according to the timeline we provided. Our plan is to finish the development of the project by the end of this semester(September). With the resources we have and the requirements gathering and analysis we have done, we will be succeeding in completing the project on time. And also, there are 5 members in the group, so there is adequate time to complete our project. So, we can assure the schedule we are following is feasible.

## **6.3 Legal Feasibility**

This is a measure of how our system can be implemented within existing legal and contractual obligations.

We can assure that the system security is really high for the users of this system and also we can assure that by the system or by using the system there will be no ethical / privacy issues or legal issues that will occur.

### **End-User Privacy**

When the customers sign up or log in to the system, no sensitive information will be collected from the customer. (No IP address tracking, email tracking or directing to unauthorized websites)

### **Government rules & regulations**

The developer has the sole authority over the system. So, there will be no issues when it comes to this aspect.

Therefore, we can claim that the system is legally feasible.

## **6.4 Economic Feasibility**

This is the part where we measure the cost-effectiveness of the project. First and foremost the developing part of the system will not be costly, as the developers are undergraduates with a purpose and will not be considering using tools that have to be purchased or paid. So the developing part will be cost-free. And also, we have to bear a considerable amount of cost as the project communication cost because of the current Covid-19 situation, we are forced to use distance communication via zoom meetings and mobile phones. We planned to use our own hardware equipment. Hence there is no additional hardware cost for the project. The cost of the paperwork is reduced by using the electronic media(notebook, MS office)

Since there are no considerable expenses, the project is economically feasible.

## **6.5 Technical Feasibility**

This is a measure of the practicality of the technical solutions and the availability of technical expertise.

The system will be implemented as a mobile responsive web application.

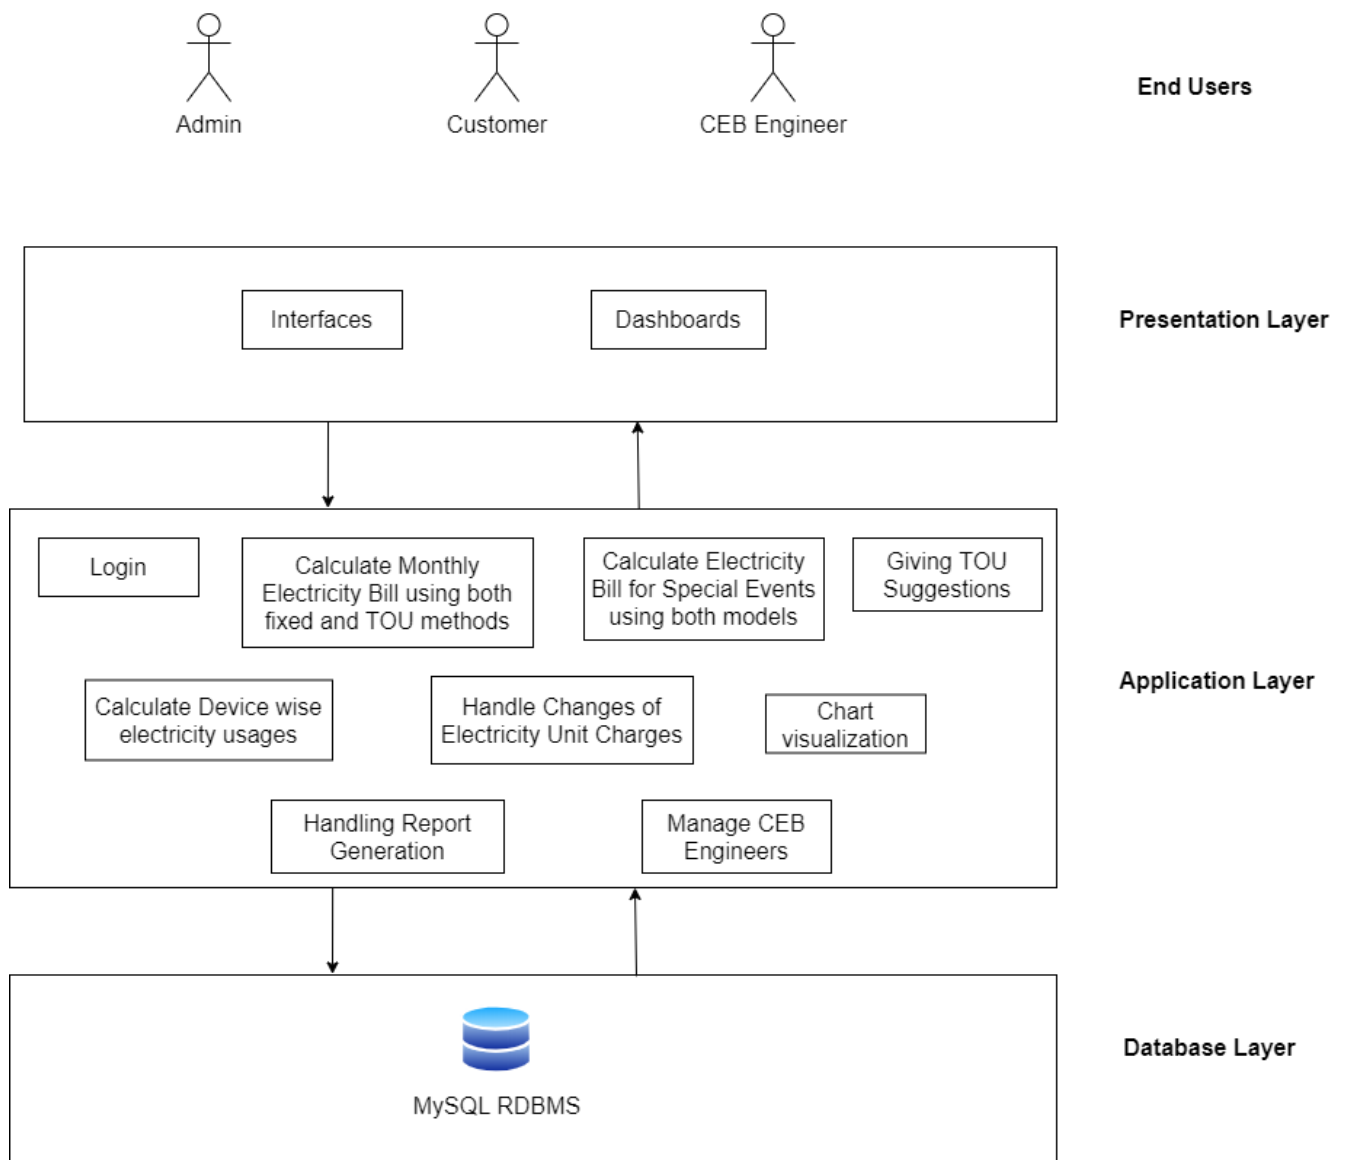

The front end of the mobile app will be developed using React Native while the front end of the web application will be developed using Reactjs.

For the back-end of the system, we will be using Nodejs and for the database, we will be using MYSQL whilst Git and GitHub will be used for the version controlling aspect. And also we will be using Visual Studio Code as our IDE, Microsoft Office and Grammarly[4] for the Tools and Utilities. Furthermore, we will be using Figma[5] as our collaborative interface designing tool and Draw.io[6] for drawing the UML diagrams. All the above-mentioned technologies are the ones all five members are familiar with and have worked with so far. All the technologies we will be using are freely available on the web.

Apart from that, we are planning to adapt to new technologies meanwhile to enhance the development of the system as all the team members have similar skill-sets. Hence our project is technically feasible.

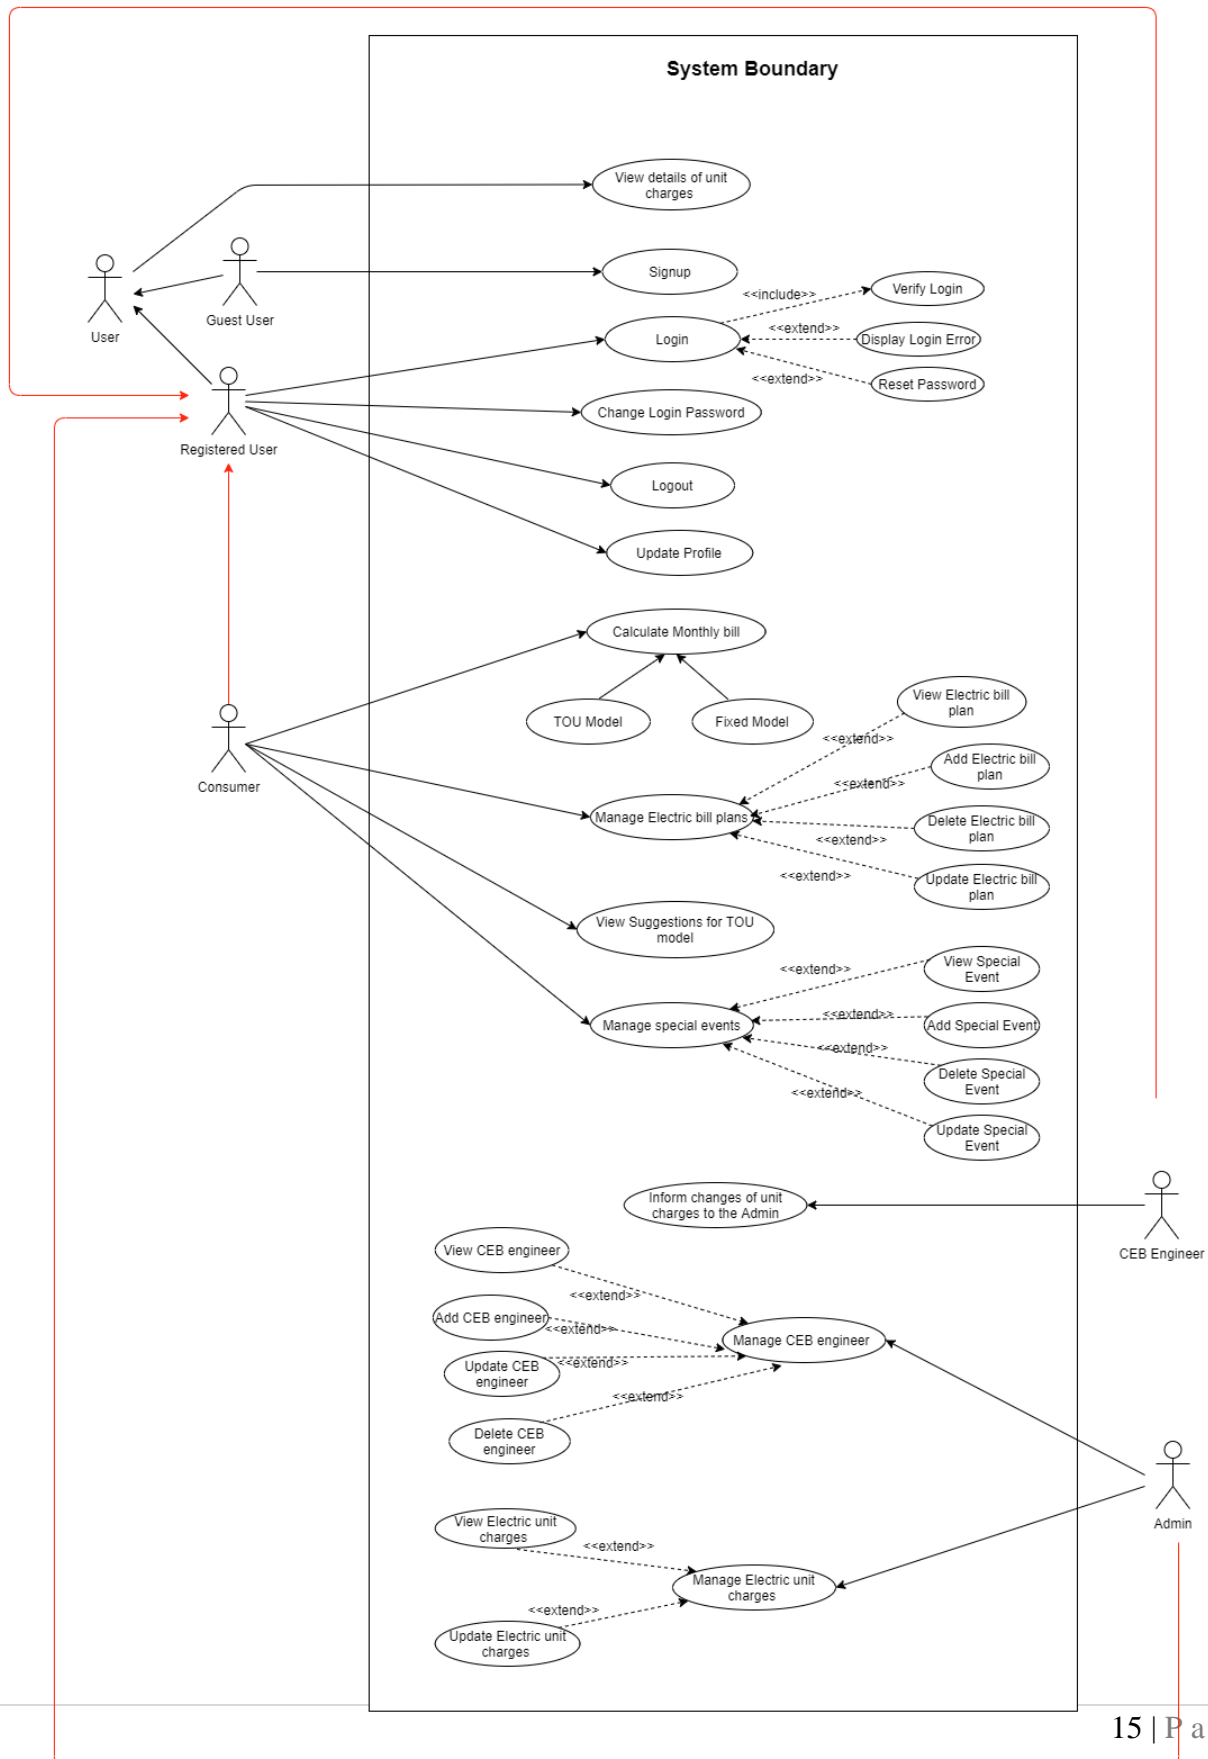

With all these five feasibility in check, we can safely assume that this is a feasible project in both the long and short run, thus we should proceed further with the development of this system.

## 7) Systems Architecture

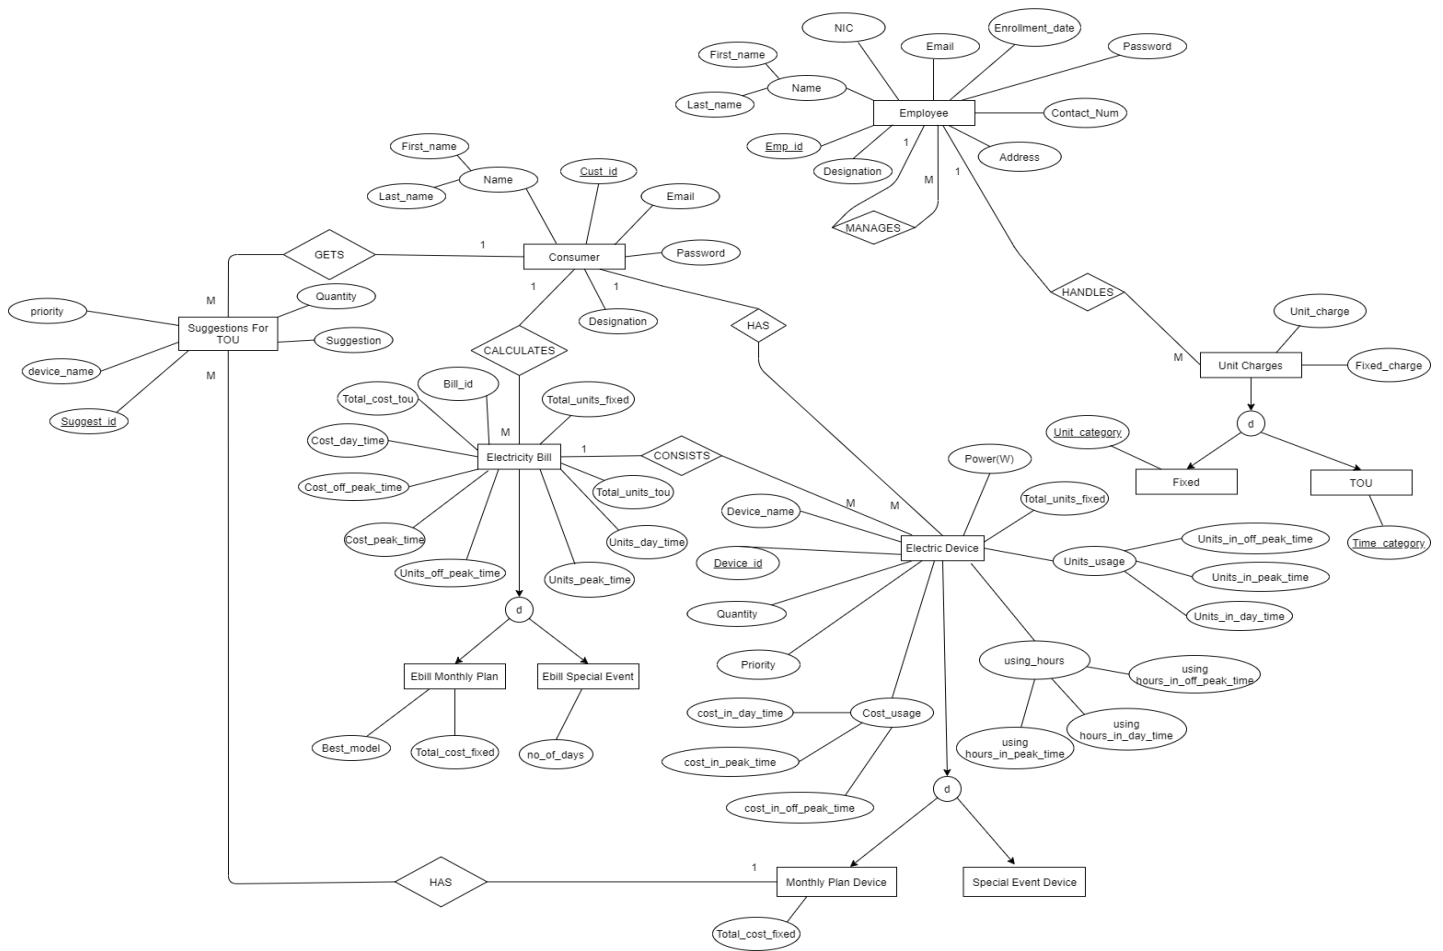

## 8) Requirements Specification

### 8.1 Use Case Diagram

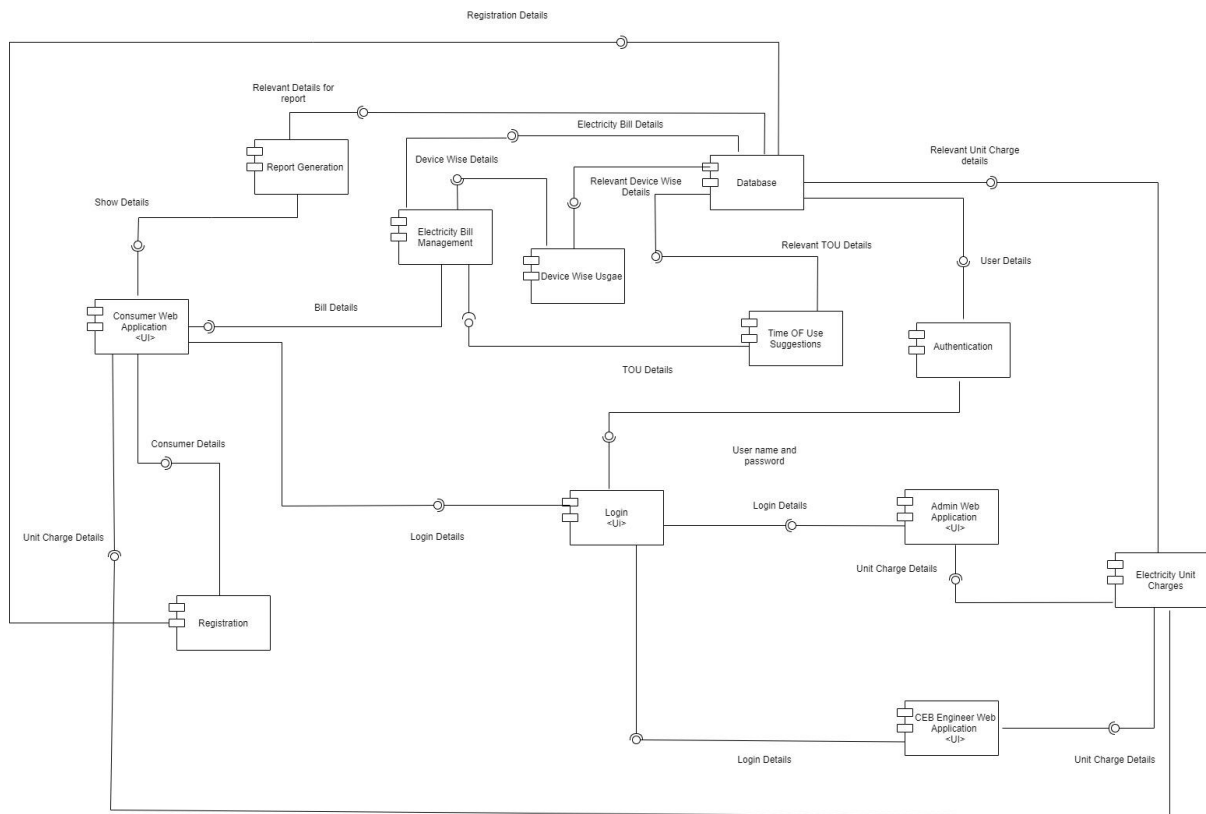

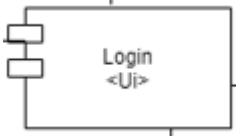

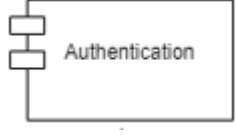

## 8.2 ER Diagram

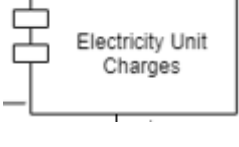

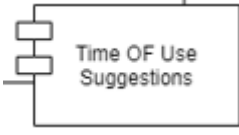

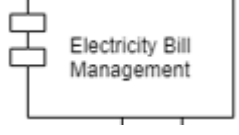

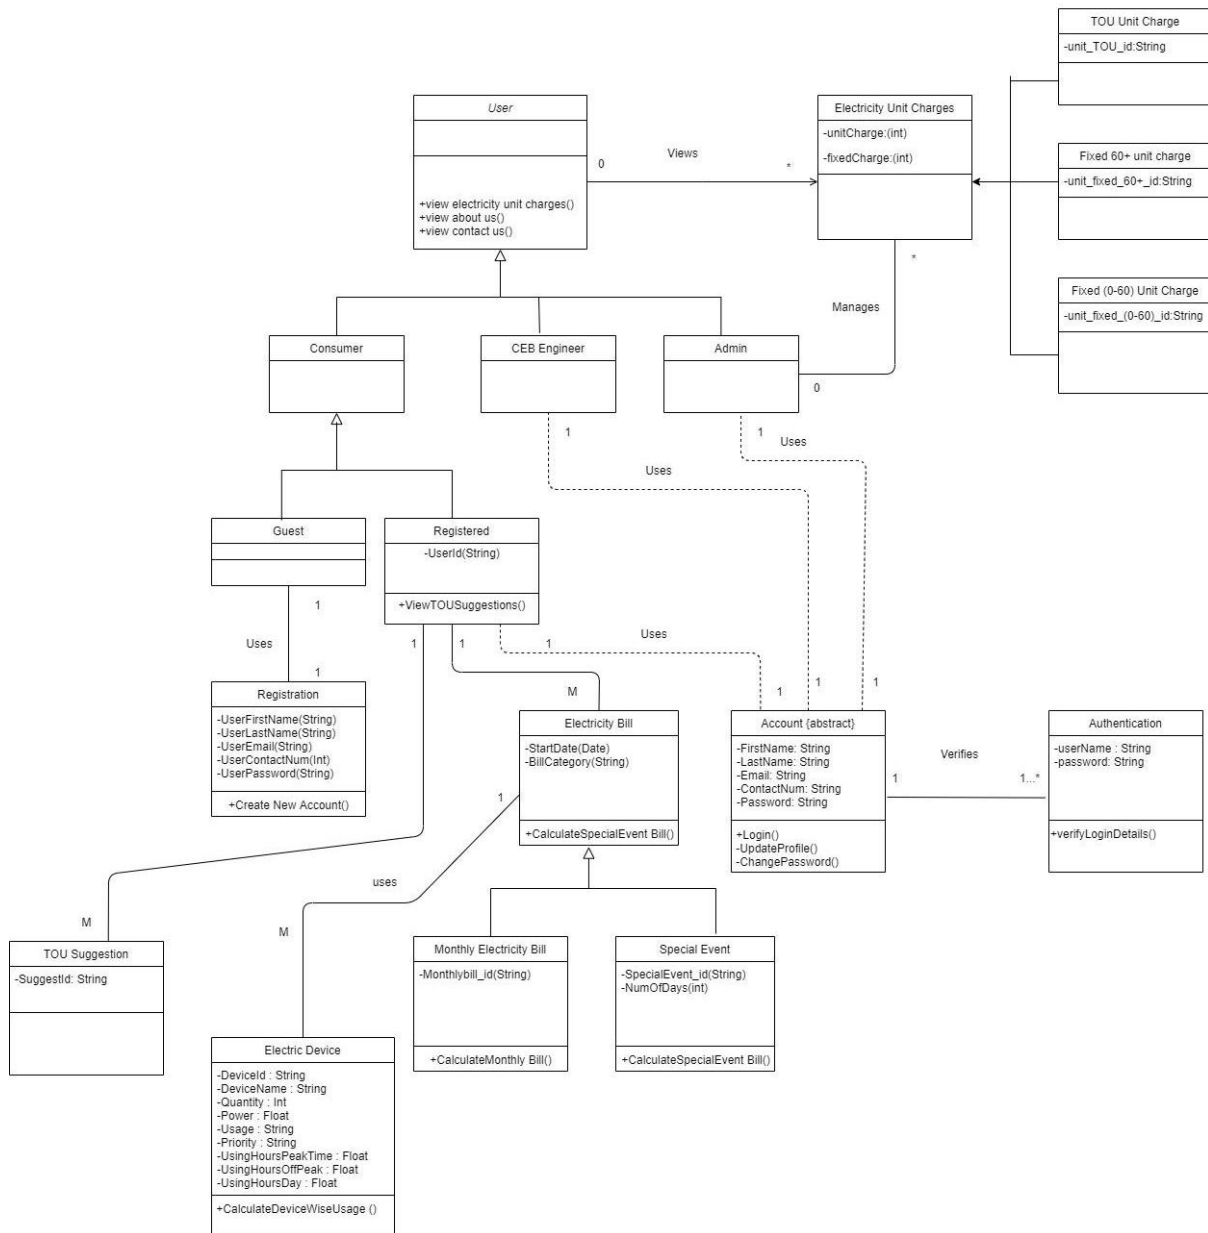

## 8.3 Component Diagram

Component	Description
	This component initializes the registration process and registers new consumers to the system.
	This UI component supplies the system access for the consumers, admin and CEB engineers. This will get the login details from the users and connect with the authentication process to verify the users and give them access to the system.
	This component will fetch the user id and password from the database and verify users when they give login details to the system.
	This UI component represents the consumer role of the system. Consumers of the system can manage their bill plans and view device-wise usage details of every plan.

 <pre> classDiagram     class AdminWebApplication["Admin Web Application&lt;UI&gt;"]     </pre>	<p>This UI component represents the admin role of the system. Admin of the system can add/update/remove/view the details of the CEB engineers. And also, the admin will be the one who manages the unit charge detail updates received by the CEB engineer.</p>
 <pre> classDiagram     class CEBEngineerWebApplication["CEB Engineer Web Application&lt;UI&gt;"]     </pre>	<p>This UI component represents the CEB engineer role of the system. CEB engineers can inform about the changes of the unit prices to the admin.</p>
 <pre> classDiagram     class ElectricityUnitCharges["Electricity Unit Charges"]     </pre>	<p>This component represents the electricity unit charge details of the system. This component fetches data from the database component. When admin updates unit charge details and CEB engineers inform about unit charge details, that processes happen through this component.</p>
 <pre> classDiagram     class TimeOFUseSuggestions["Time OF Use Suggestions"]     </pre>	<p>This UI component represents the TOU suggestions for the devices. This will fetch the details related to the TOU model from the database and give suggestions to reduce the electricity bill.</p>
 <pre> classDiagram     class DeviceWiseUsage["Device Wise Usage"]     </pre>	<p>This UI component represents the device-wise usage details of the system. According to the details given by the users about their electric devices, this will fetch those details from the database and help to show the device-wise usage details graphically for the consumers.</p>
 <pre> classDiagram     class ElectricityBillManagement["Electricity Bill Management"]     </pre>	<p>This UI component represents the electricity bill management of the system. This will manage the details of the Time of Use model and the details of the Normal billing method and helps to calculate the bill for the consumers in both methods.</p>

### 8.5.1 Login UI flow

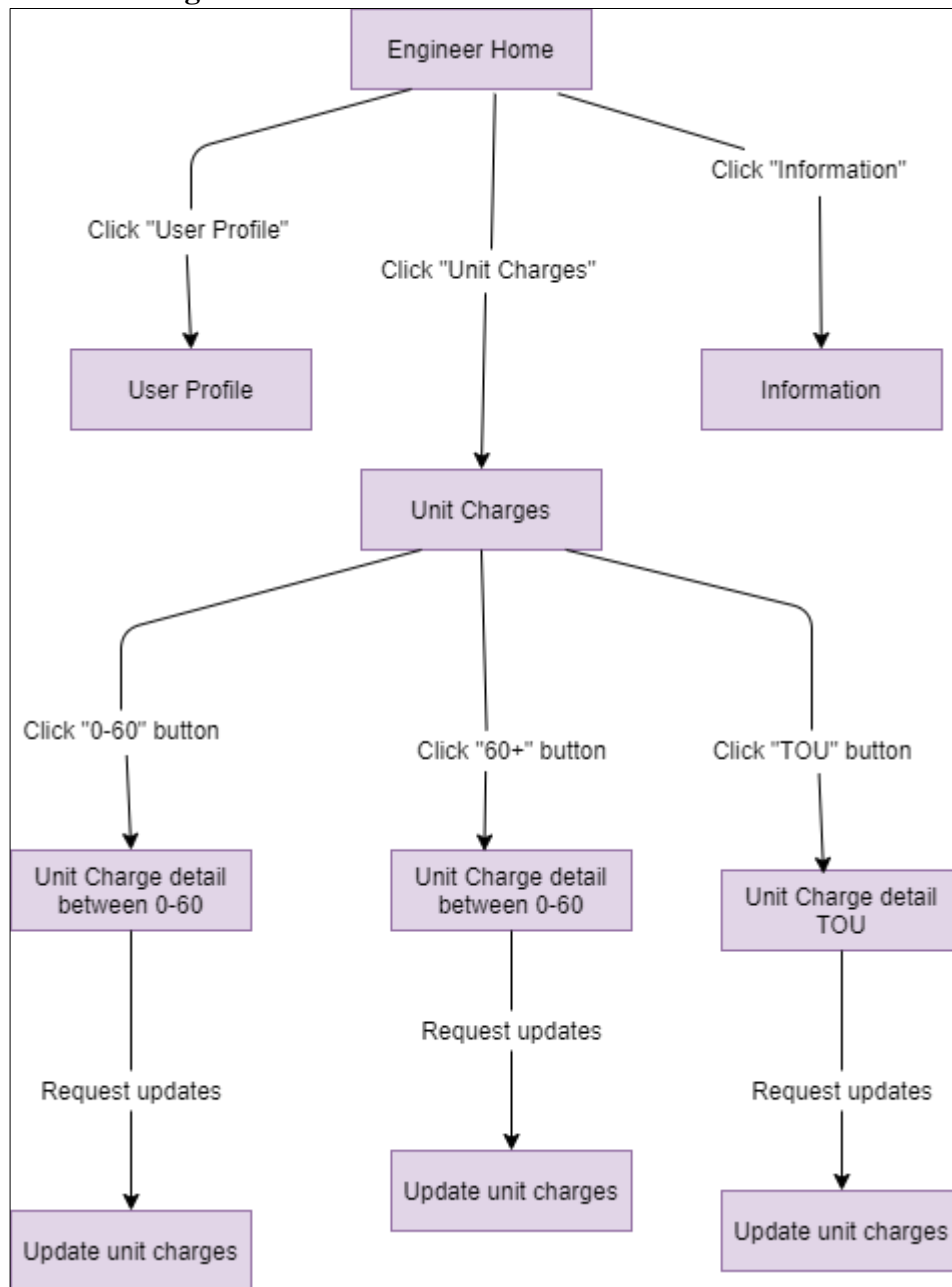

### 8.5.2 Customer UI flow

8.5.3 Admin UI flow

#### 8.5.4 CEB engineer UI flow

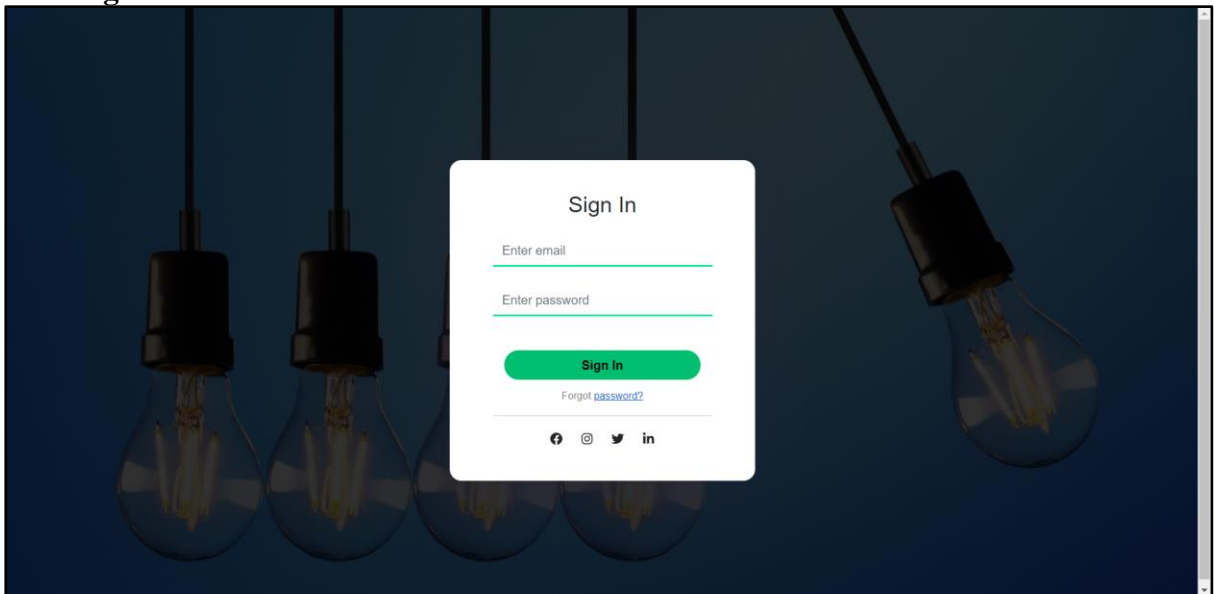

## 9) User Interfaces

- We used a simple design to create our user interfaces to make it easier for users to engage with our system.
- We used buttons and several other options to limit the number of actions required to perform a task by the users and to prevent making users think too hard to achieve a required goal.
- We tried to avoid using new terms for our system and used words that are using commonly in other applications. It makes users think less when a user has to do a particular task using our system.

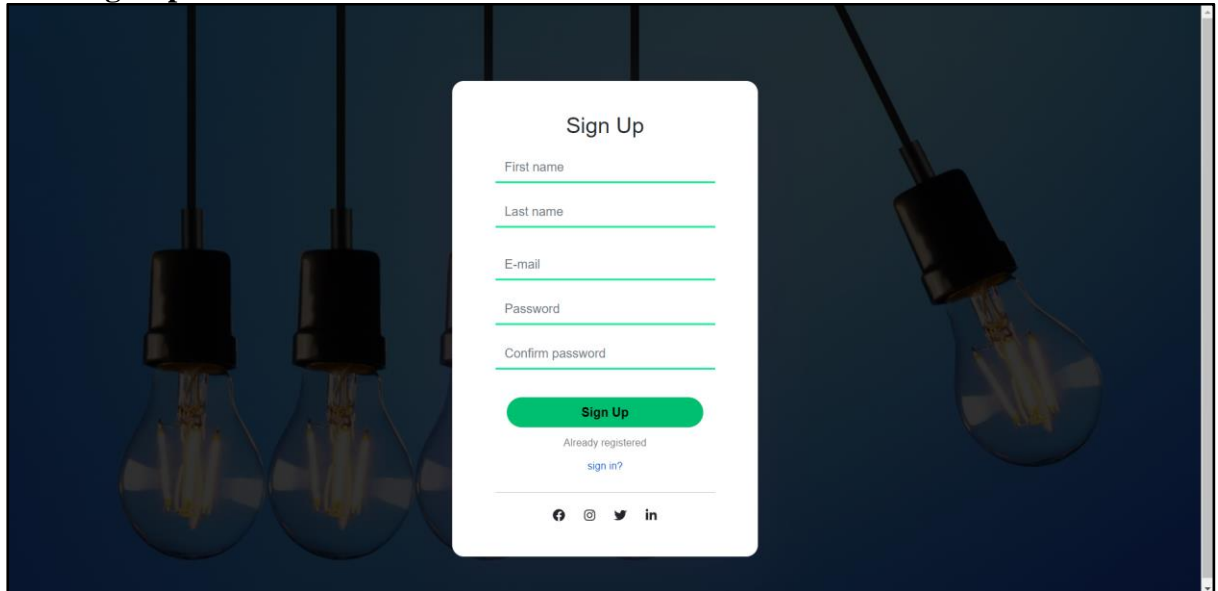

All the UI we created are added below in order to elaborate on the above-mentioned points.

### 9.1 For All Users

#### 9.1.1 Sign-in

### 9.1.3 Sign-up

A white rectangular sign-up form is centered over a dark background featuring several hanging incandescent light bulbs. The form has a title 'Sign Up' at the top. Below it are five input fields: 'First name', 'Last name', 'E-mail', 'Password', and 'Confirm password'. Each field has a green underline. A green button with the text 'Sign Up' is positioned below the input fields. Underneath the button, there is a link that says 'Already registered sign in?'. At the bottom of the form, there are four social media icons: Facebook, Instagram, Twitter, and LinkedIn.

### Tariff Plan

The following Electricity Tariffs have been approved by the Public Utility Commission of Sri Lanka.

#### Domestic (D-1)

If 30 day Consumption is between 0-60 kWh per month the following tariffs will be applicable.

Monthly Consumption (kWh)	Unit Charge (LKR/kWh)	Fixed Charge (LKR/month)
0-30	2.50	30.00
31-60	4.85	60.00

If 30 day consumption is above 60kWh per month the following tariffs will be applicable.

Monthly Consumption (kWh)	Unit Charge (LKR/kWh)	Fixed Charge (LKR/month)
0-60	7.85	N/A
61-90	10.00	90.00
91-120	27.75	480.00
121-180	32.00	480.00
More than 180	32.00	540.00

#### Domestic Time of Use

Time of Use	Unit Charge (LKR/kWh)	Fixed Charge (LKR/month)
Off Peak (2230-0530 hrs)	13.00	540.00
Day (0530-1830 hrs)	25.00	540.00
Peak (1830-2230 hrs)	54.00	540.00

### 9.3.3 UI for updating unit charges

ELECTRO					Home	About Us	Contact Us	Log Out
Ms. Hasini Administrator Active								
Dashboard Unit Charges Manage CEB Engineer User Profile Information								
FIXED BILLING MODEL (ONLY FOR 60kWh+)								
Category		Unit Charge(LKR/kWh)		Fixed Charge(LKR/month)				
00-60		7.85		UPDATE		N/A		
61-90		10.00		UPDATE		90.00		
91-120		27.75		UPDATE		480.00		
121-180		32.00		UPDATE		480.00		
> 180		45.00		UPDATE		540.00		

### 9.3.4 Pop up window when updating unit charges

The screenshot shows the ELECTRO dashboard with a sidebar on the left containing a user profile for Ms. Hasini (Administrator, Active) and a menu with options: Dashboard, Unit Charges, Manage CEB Engineer, User Profile, and Information. The main content area is titled "FIXED BILLING MODEL (ONLY FOR 60kWh+)" and displays a table of unit charges. A modal window titled "Update Unit Charges" is open, showing the following details:

Field	Value
Current Unit Price	LKR : 7.85
Increasing Amount	LKR : 1.50
New Unit Price	LKR : 9.35

At the bottom of the modal are two buttons: "Accept" (blue) and "Reject" (orange). The background table shows unit charges for various ranges (e.g., 121-180, 32.00, 480.00) with "UPDATE" buttons.

### 9.3.5 Managing CEB Engineer

The screenshot shows the ELECTRO dashboard with the same sidebar as above. The main content area is titled "MANAGE CEB ENGINEER" and features a "+New CEB Engineer" button. Below the title, there are two cards representing CEB Engineers, each with an illustration of two people reviewing a document and a green checkmark:

- W.K.B.K.Madhushanka**  
Engineer\_ID : E 01  
Buttons: More Details, Deactivate
- T.M.Jayalath**  
Engineer\_ID : E 02  
Buttons: More Details, Deactivate

## 10) Main deliverables of the system

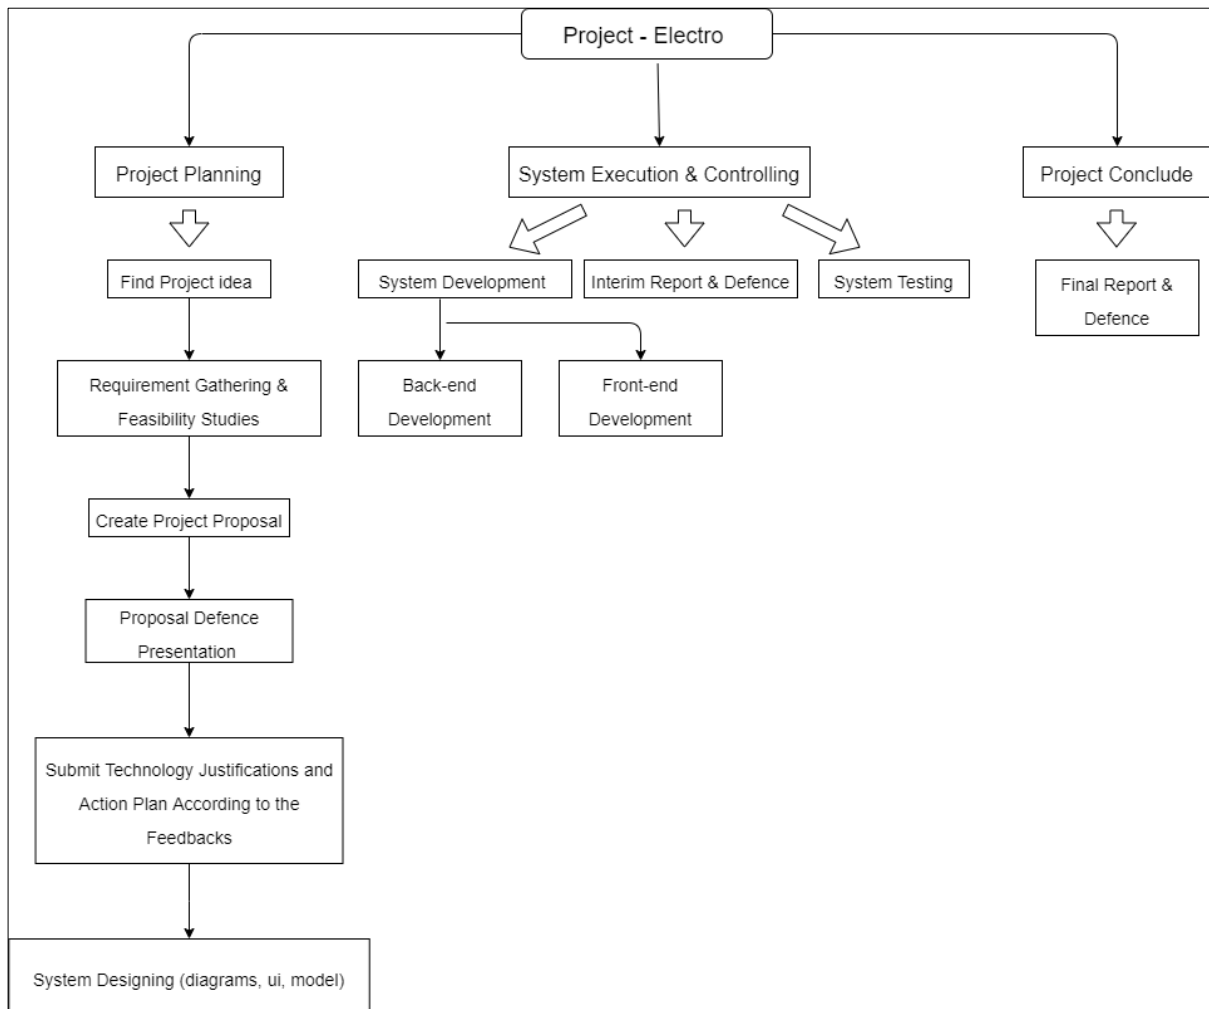

1. Complete working Mobile Application and the source code
2. Complete working web Application and the source code
3. Complete Software Requirement Specification for both mobile and web application
4. License of the software
  - React Js - Standard MIT License
  - Node Js - MIT license
  - Express Js - MIT License

## 11) The Project Plan

Start Date: 10/05/2021

Estimated End Date: 05/09/2021

### Work Breakdown Structure

Task Name	May			June				July				August				September
	Week1	Week2	Week3	Week4	Week5	Week6	Week7	Week8	Week9	Week10	Week11	Week12	Week13	Week14	Week15	Week16
<b>Project Planning</b>																
Identifying the problem																
Finding a solution																
Defining Scope																
Identifying Risks and Benefits																
<b>Analysis</b>																
Gathering Requirements																
Analysing Requirements																
Feasibility Study																
Creating Project Proposal																
Proposal Defence																
<b>System Design</b>																
Designing of the database																
Designing Software																
Designing User Interfaces																
Interim Report																
Interim Presentation																
<b>System Development</b>																
Developing System Modules																
Integrating System Modules																
Initial Testing																
Final Report(1st Draft)																
<b>System Testing</b>																
Unit Testing																
Integrate Testing																
System Testing																
Pre Final Presentation& System Demonstration																
<b>Deployment</b>																
Deployment Completion																
Creating Final Report(Final Version)																
Final Formal Presentation
